

Supplement of

Revealing the relation between spatial patterns of rainfall return levels and landslide density

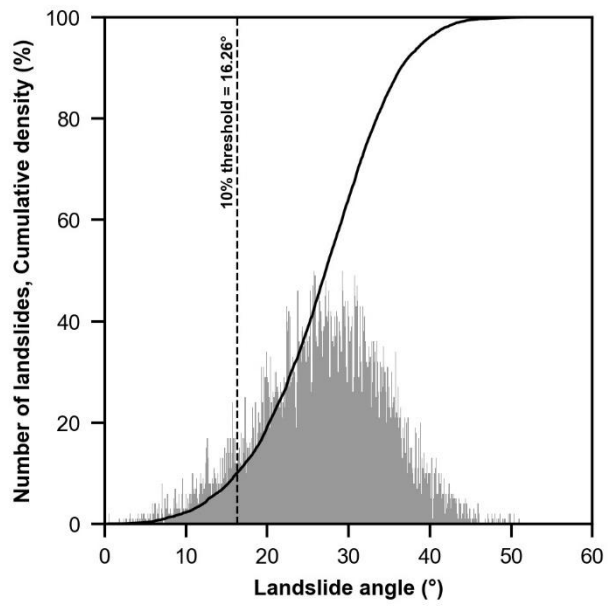

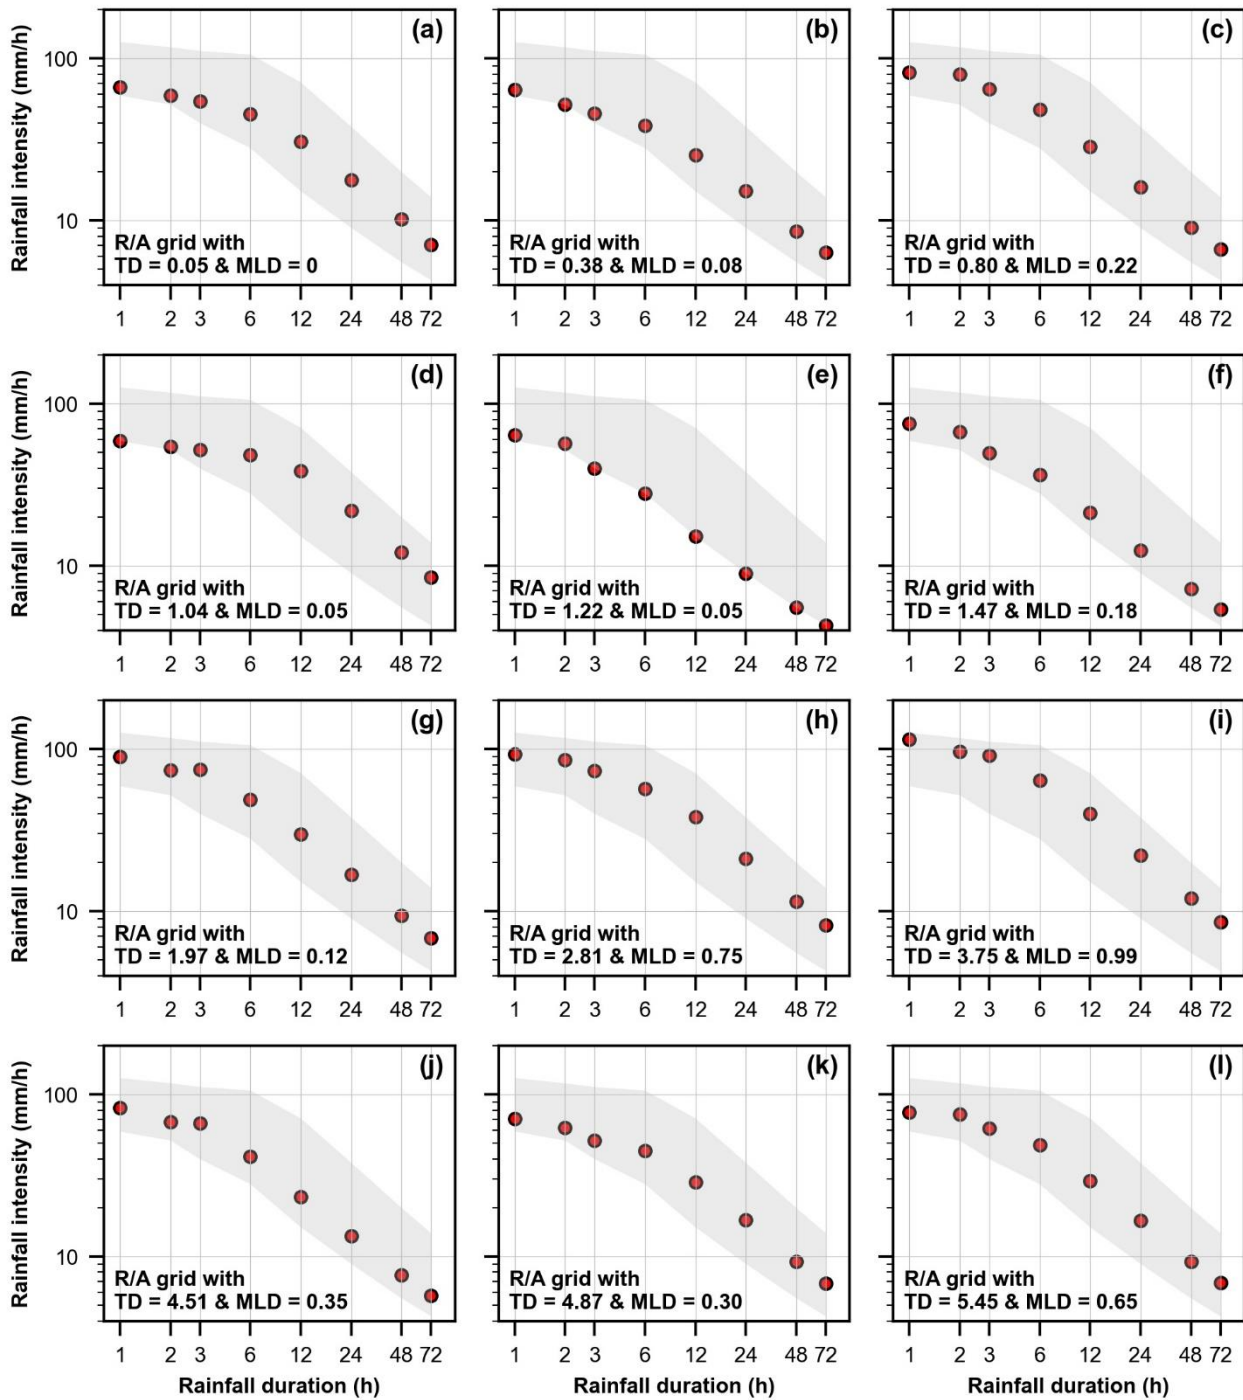

Figure S1: Non-cumulative (gray histogram) and cumulative (black line) frequency distribution of landslide angle

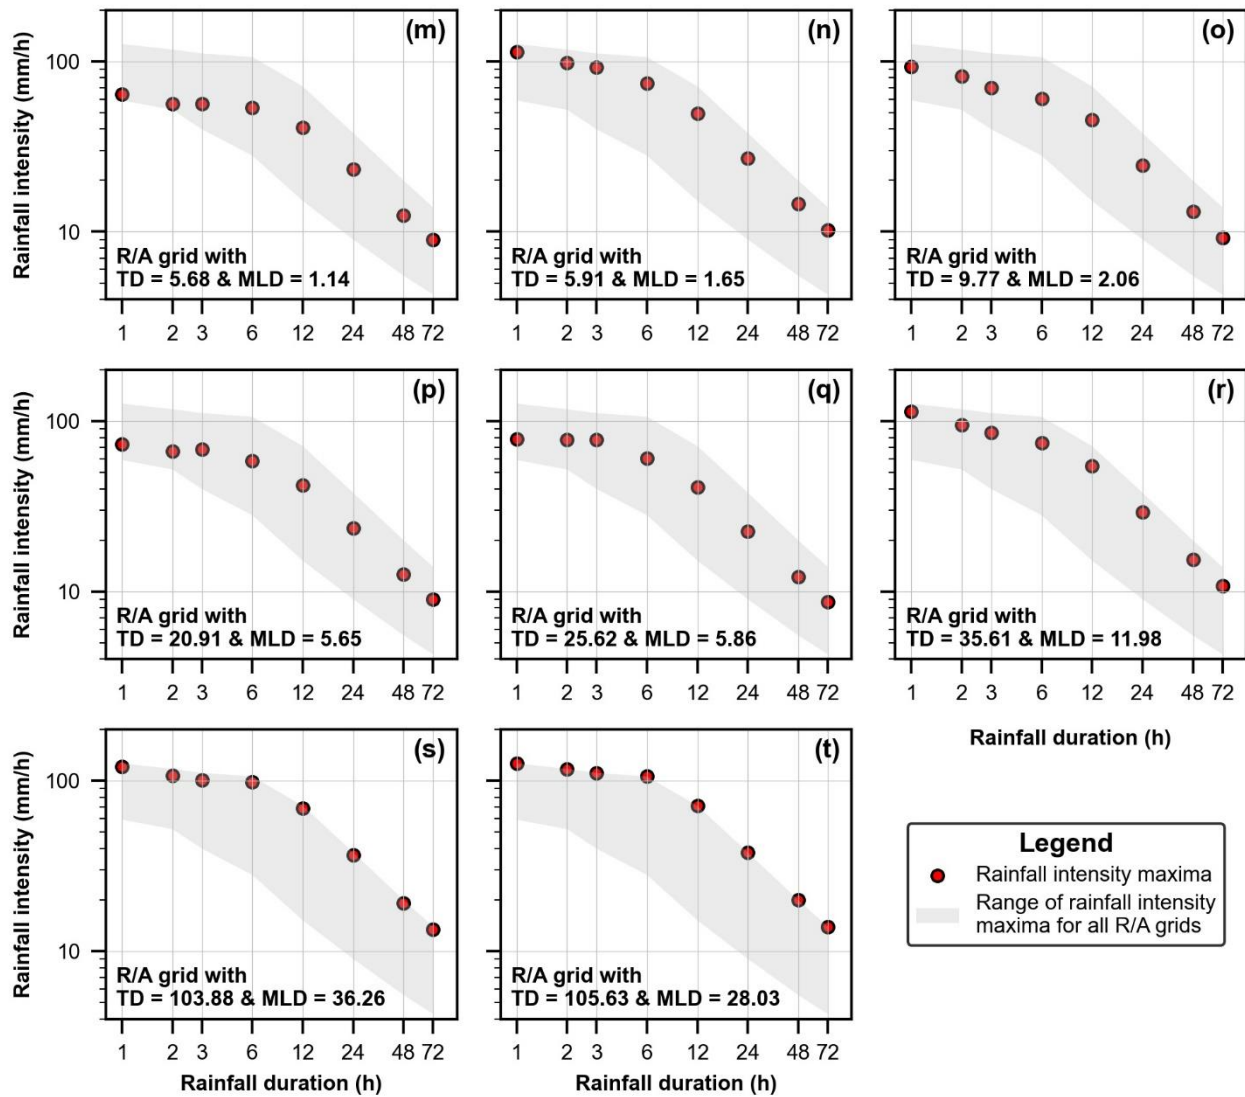

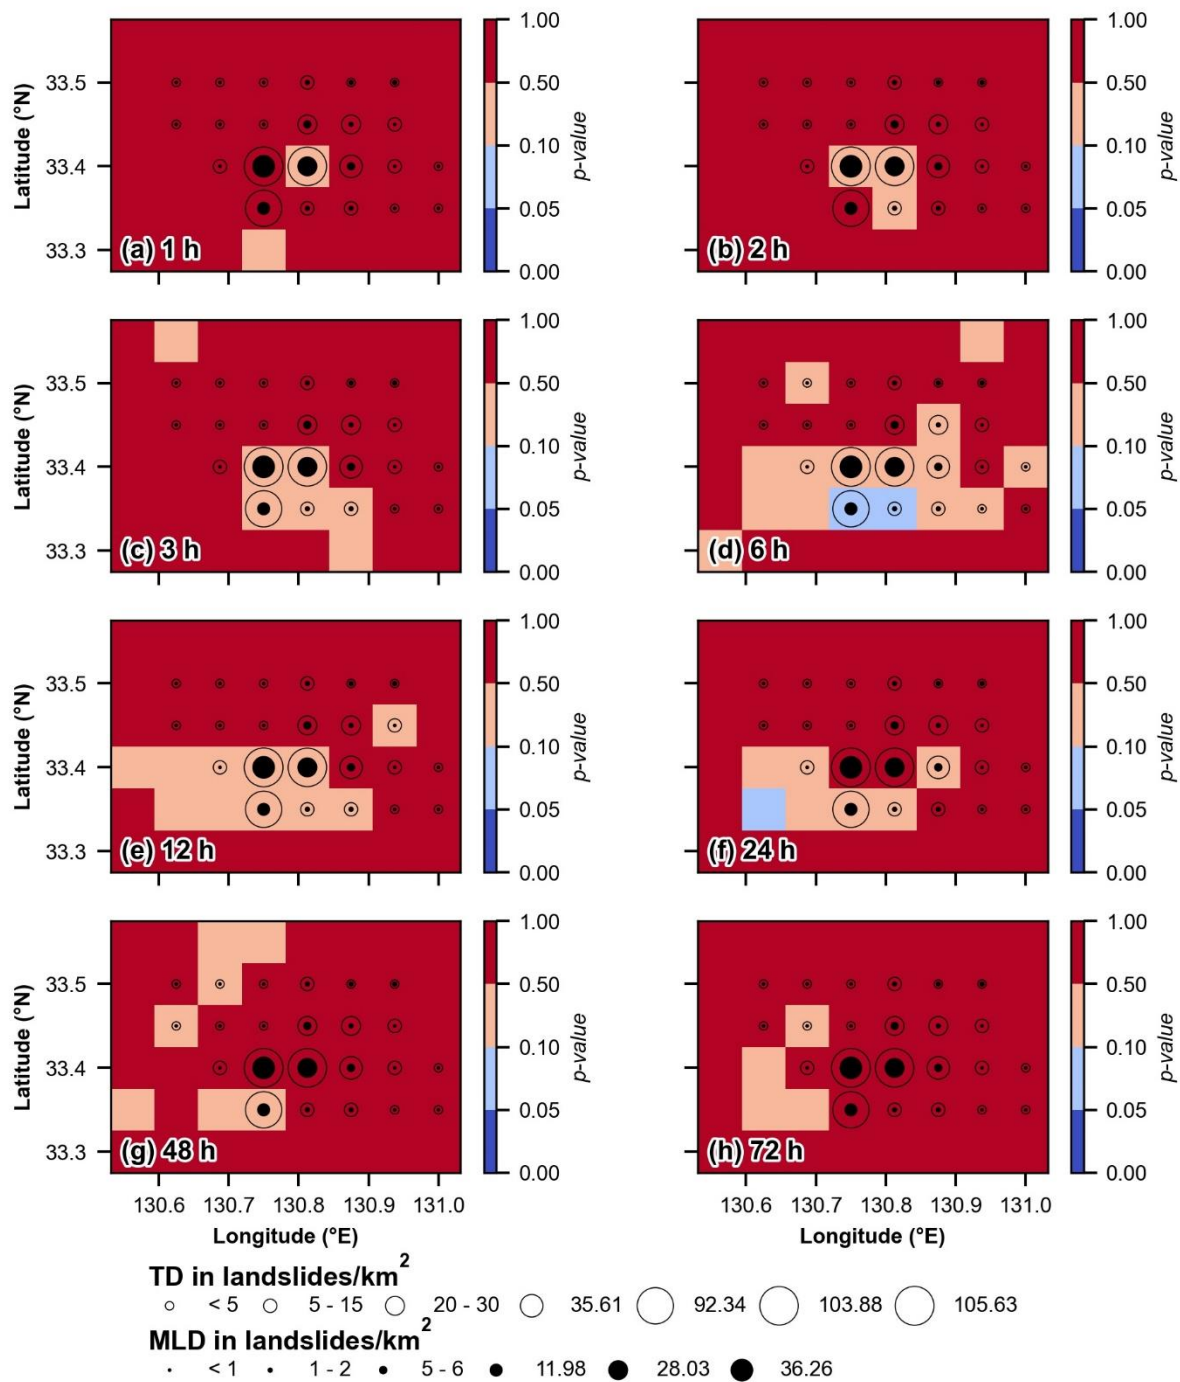

Figure S2: Rainfall intensity maxima for multiple timespans (1–72 h) within the P_{std} for the different R/A grid cells (excluding three R/A grid cells where landslide occurrence was deemed to be affected by anthropogenic activities).

10

Figure S3: Distribution of local slopes within $A_{threshold}$ of the R/A grid cells. Note that the distributions are shown as box-and-whisker plots. The box delimitates the 25th and 75th percentiles. The black line indicates the median. The red cross '+' displays the mean. The circles 'o' designate the outliers.

15

Figure S4: Spatial distribution maps of *p-values* resulted from the Kolmogorov-Smirnov test

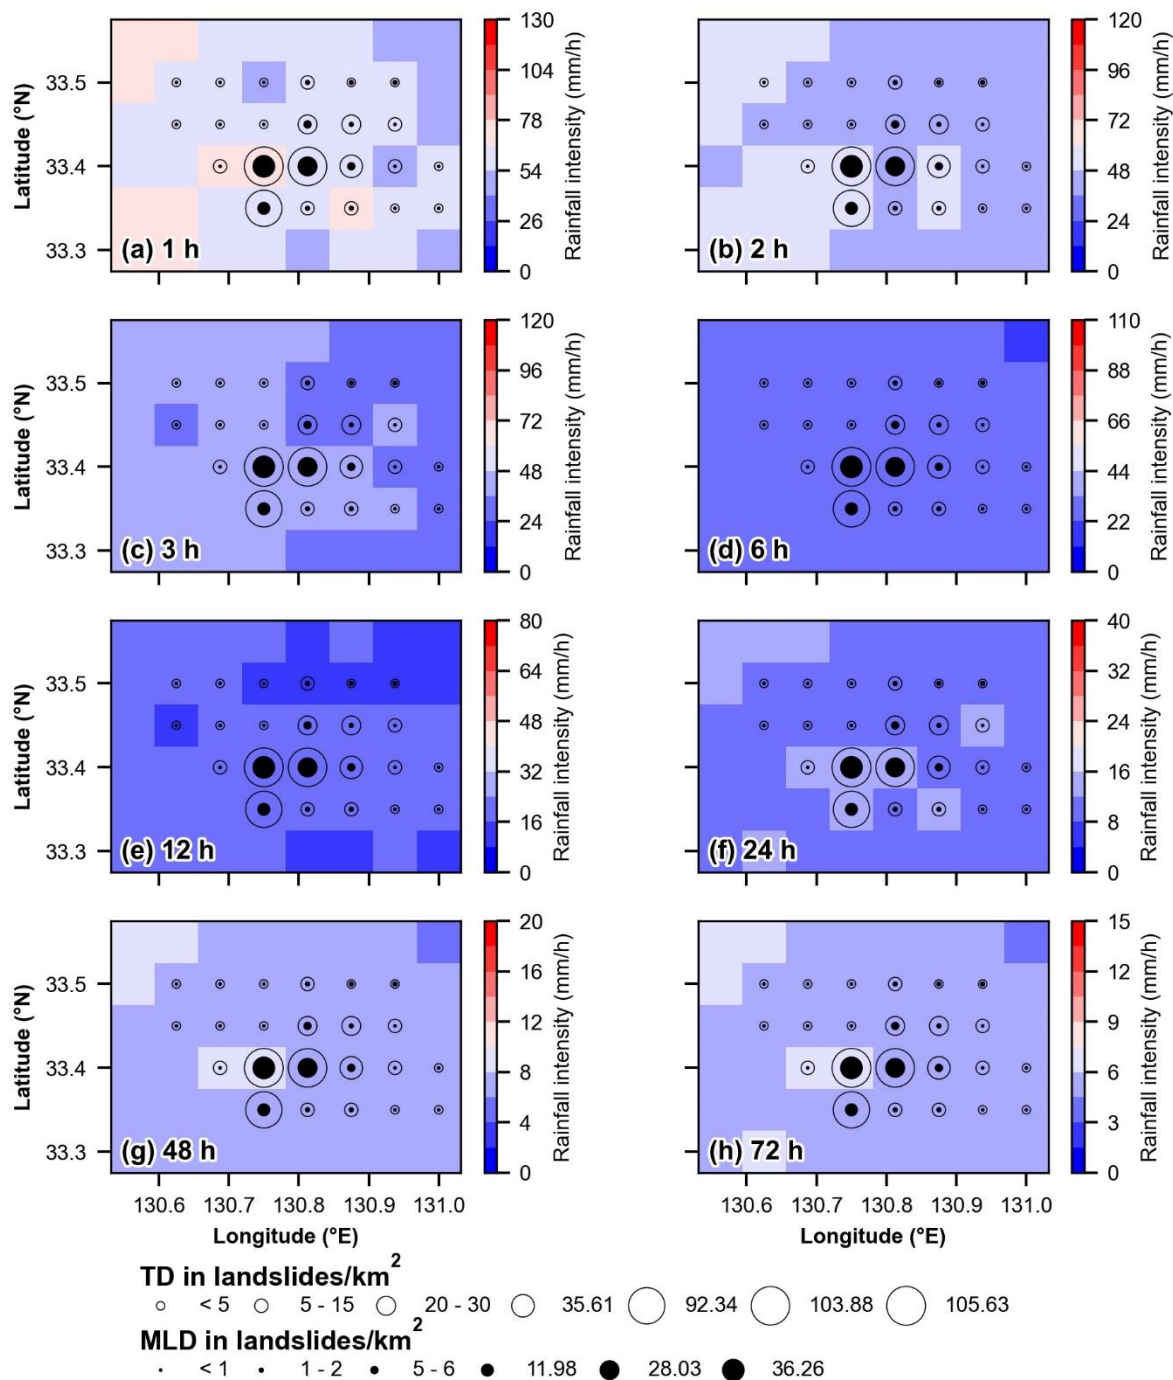

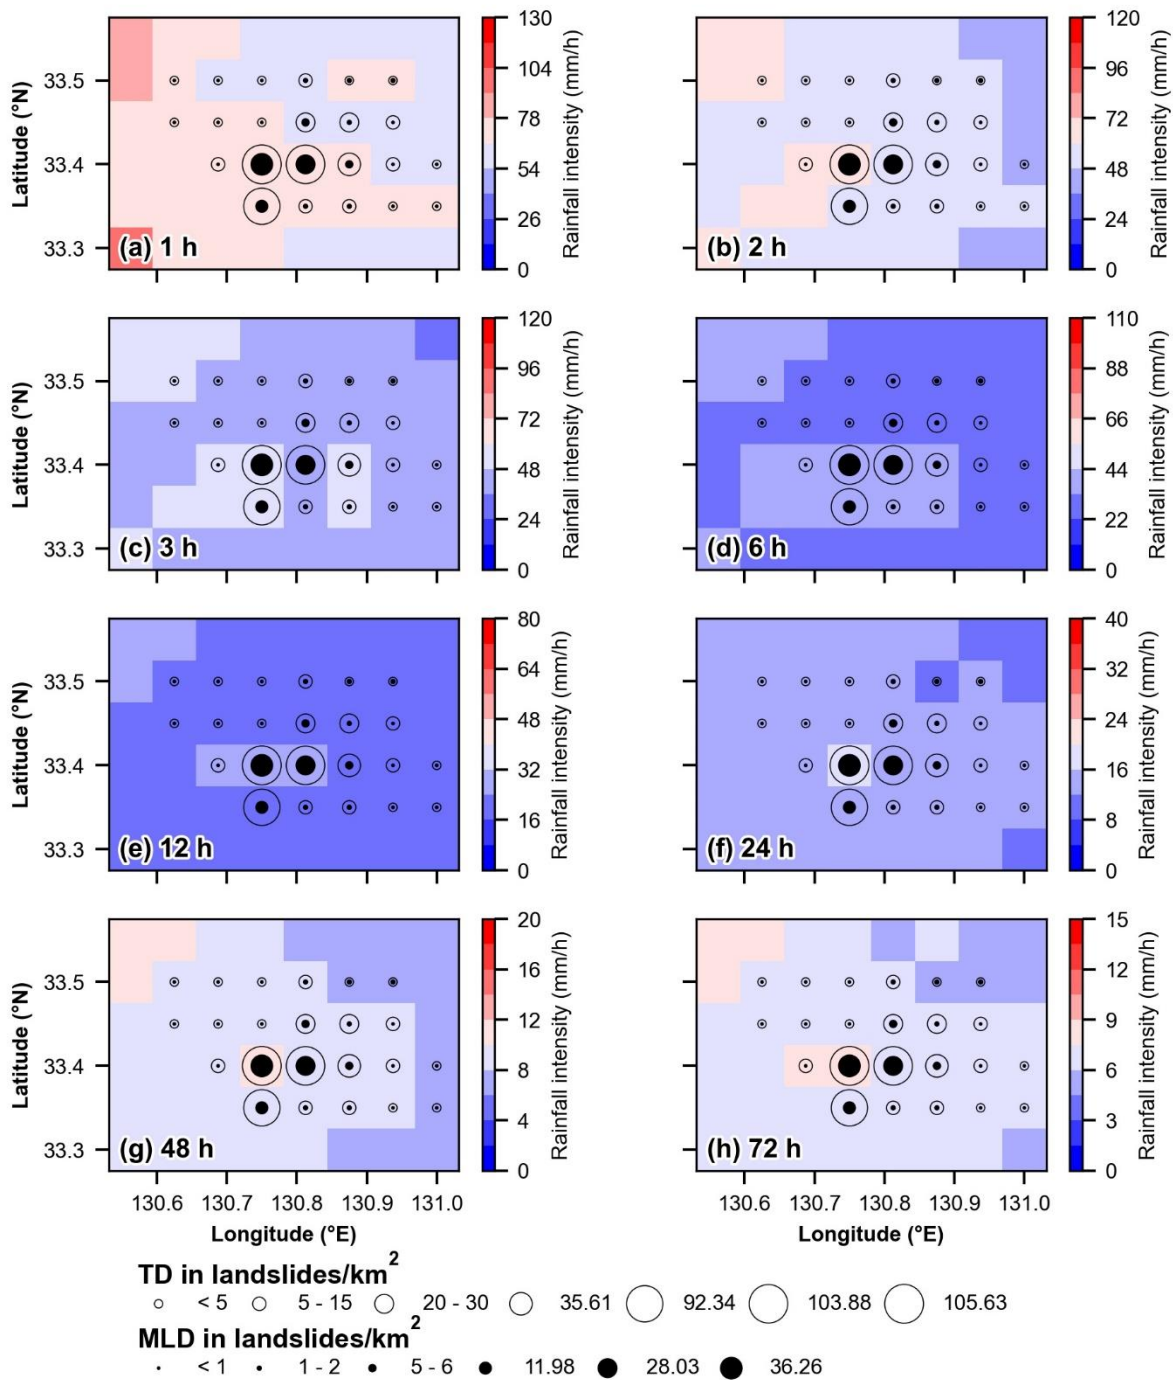

Figure S5: Estimated rainfall intensities for 5-year return period

20

Figure S6: Estimated rainfall intensities for 10-year return period

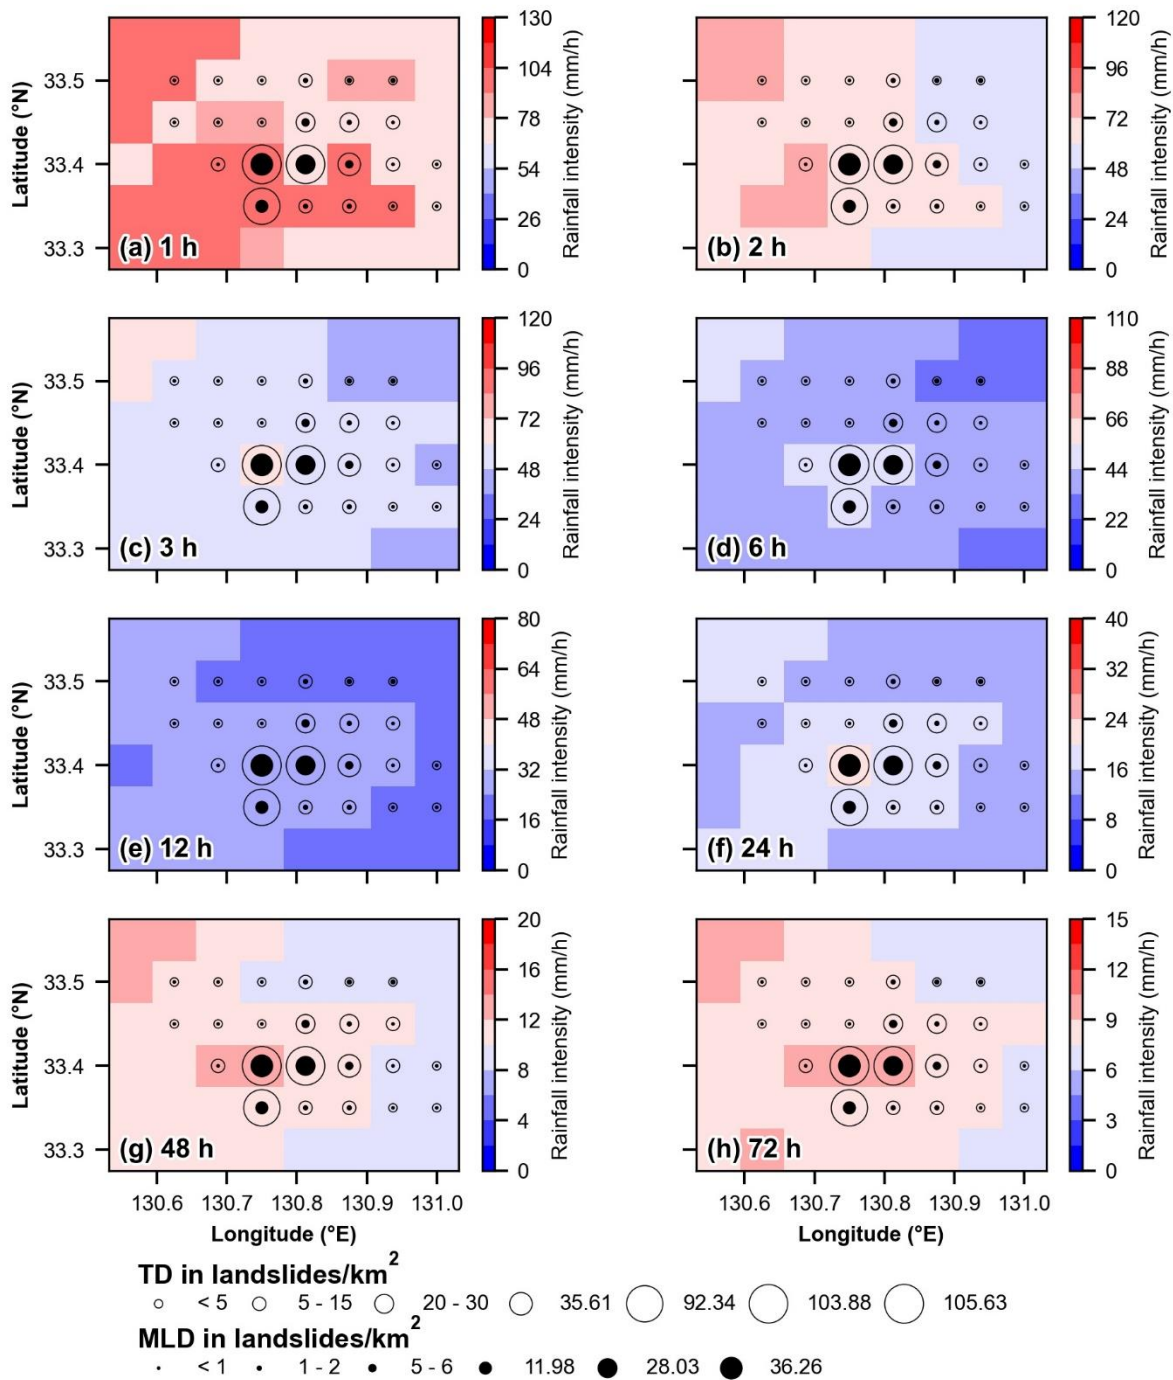

Figure S7: Estimated rainfall intensities for 25-year return period

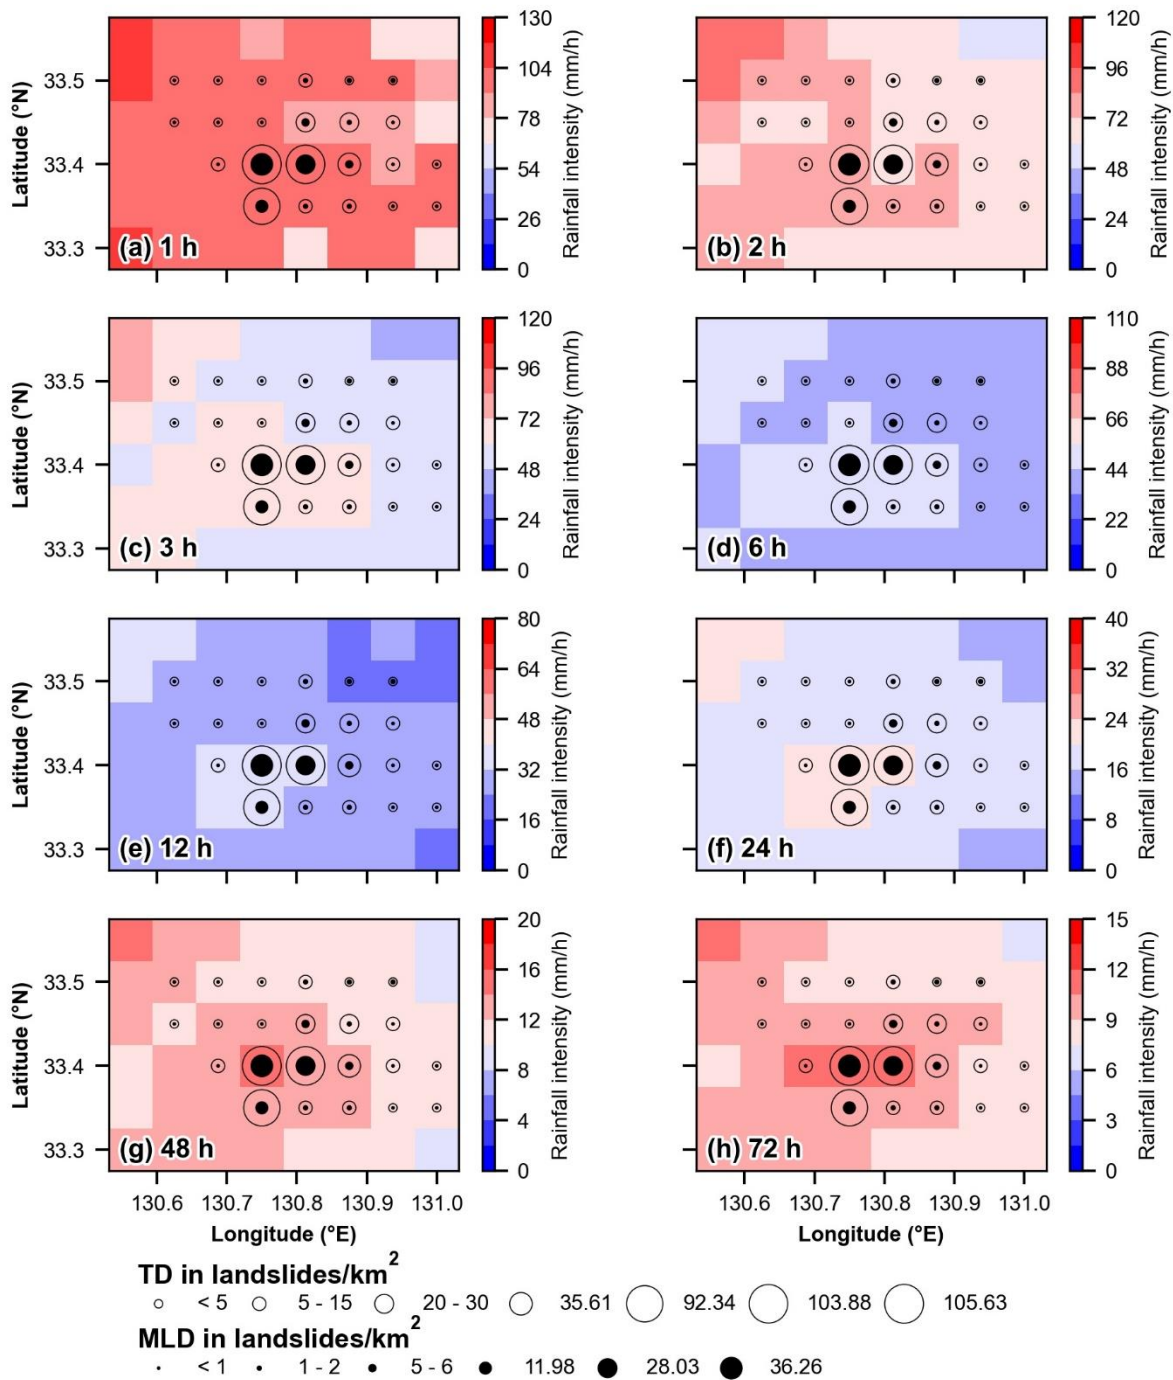

Figure S8: Estimated rainfall intensities for 50-year return period

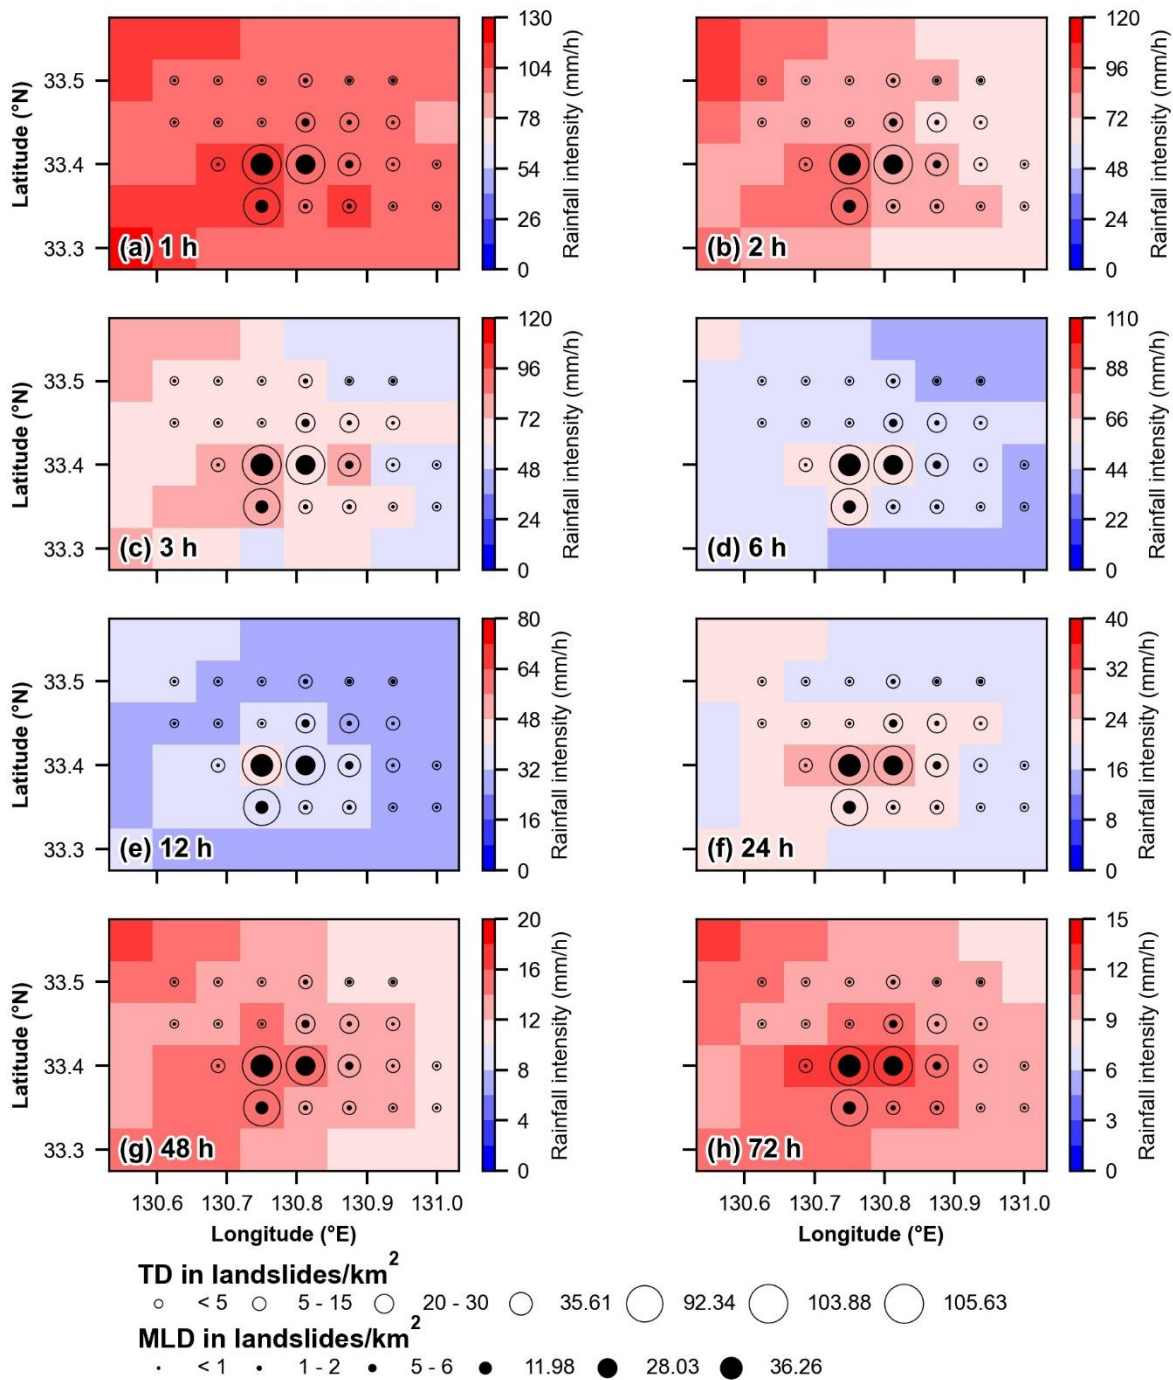

Figure S9: Estimated rainfall intensities for 100-year return period

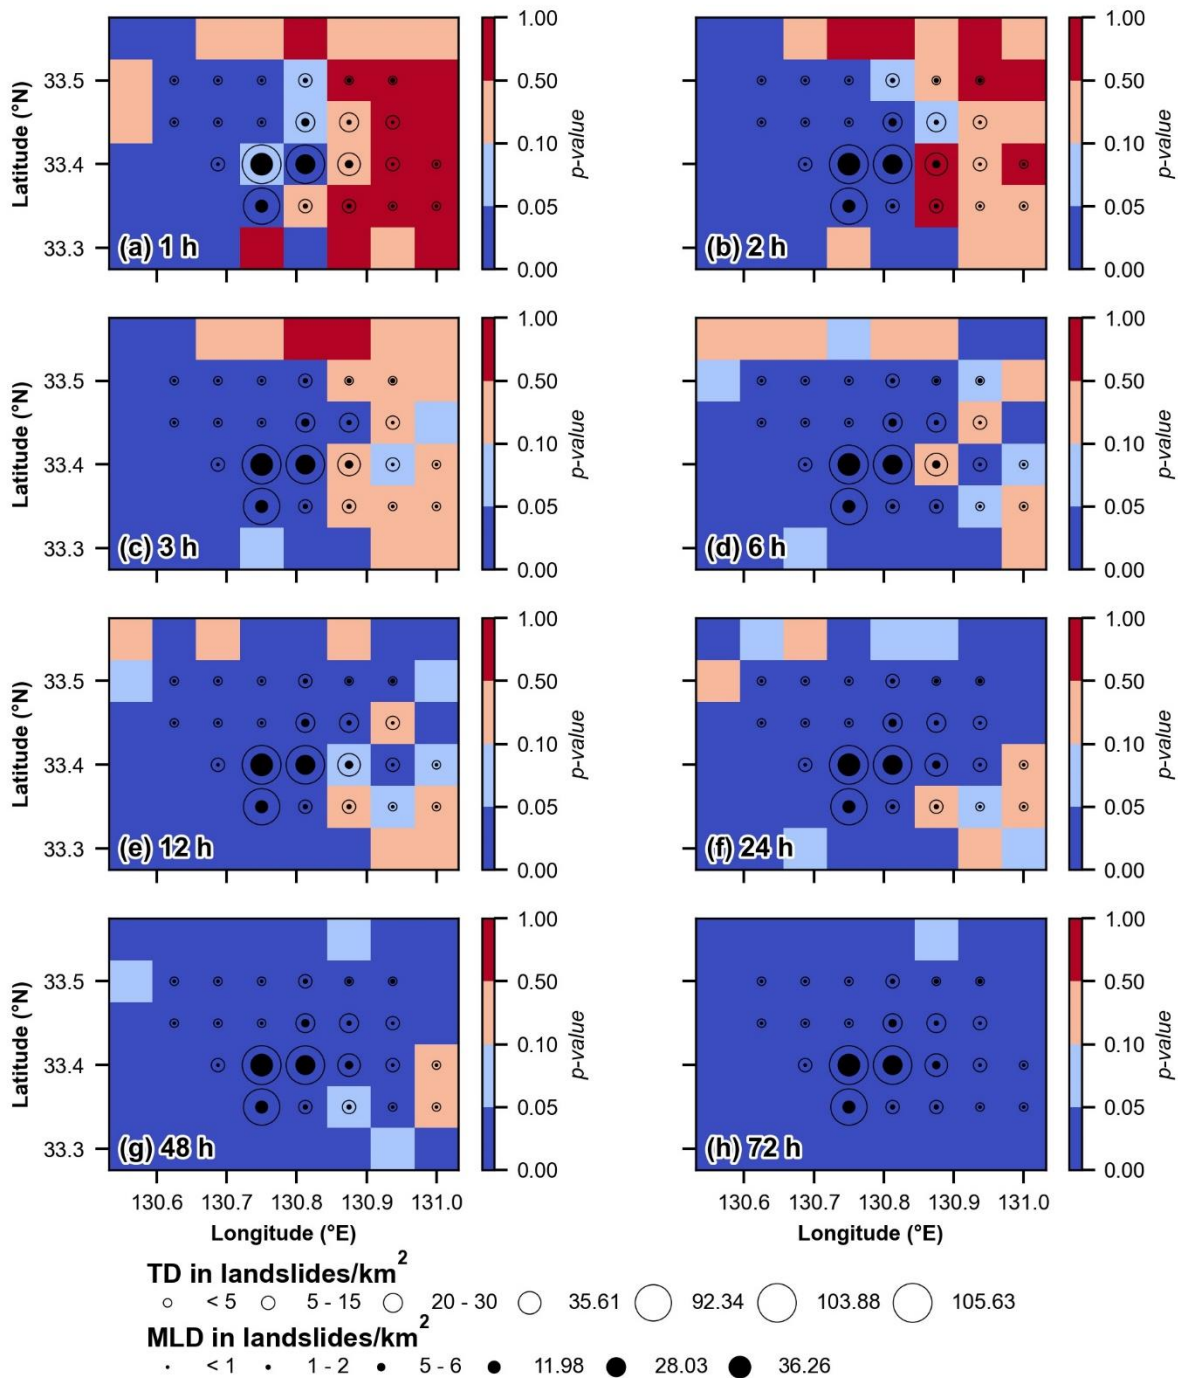

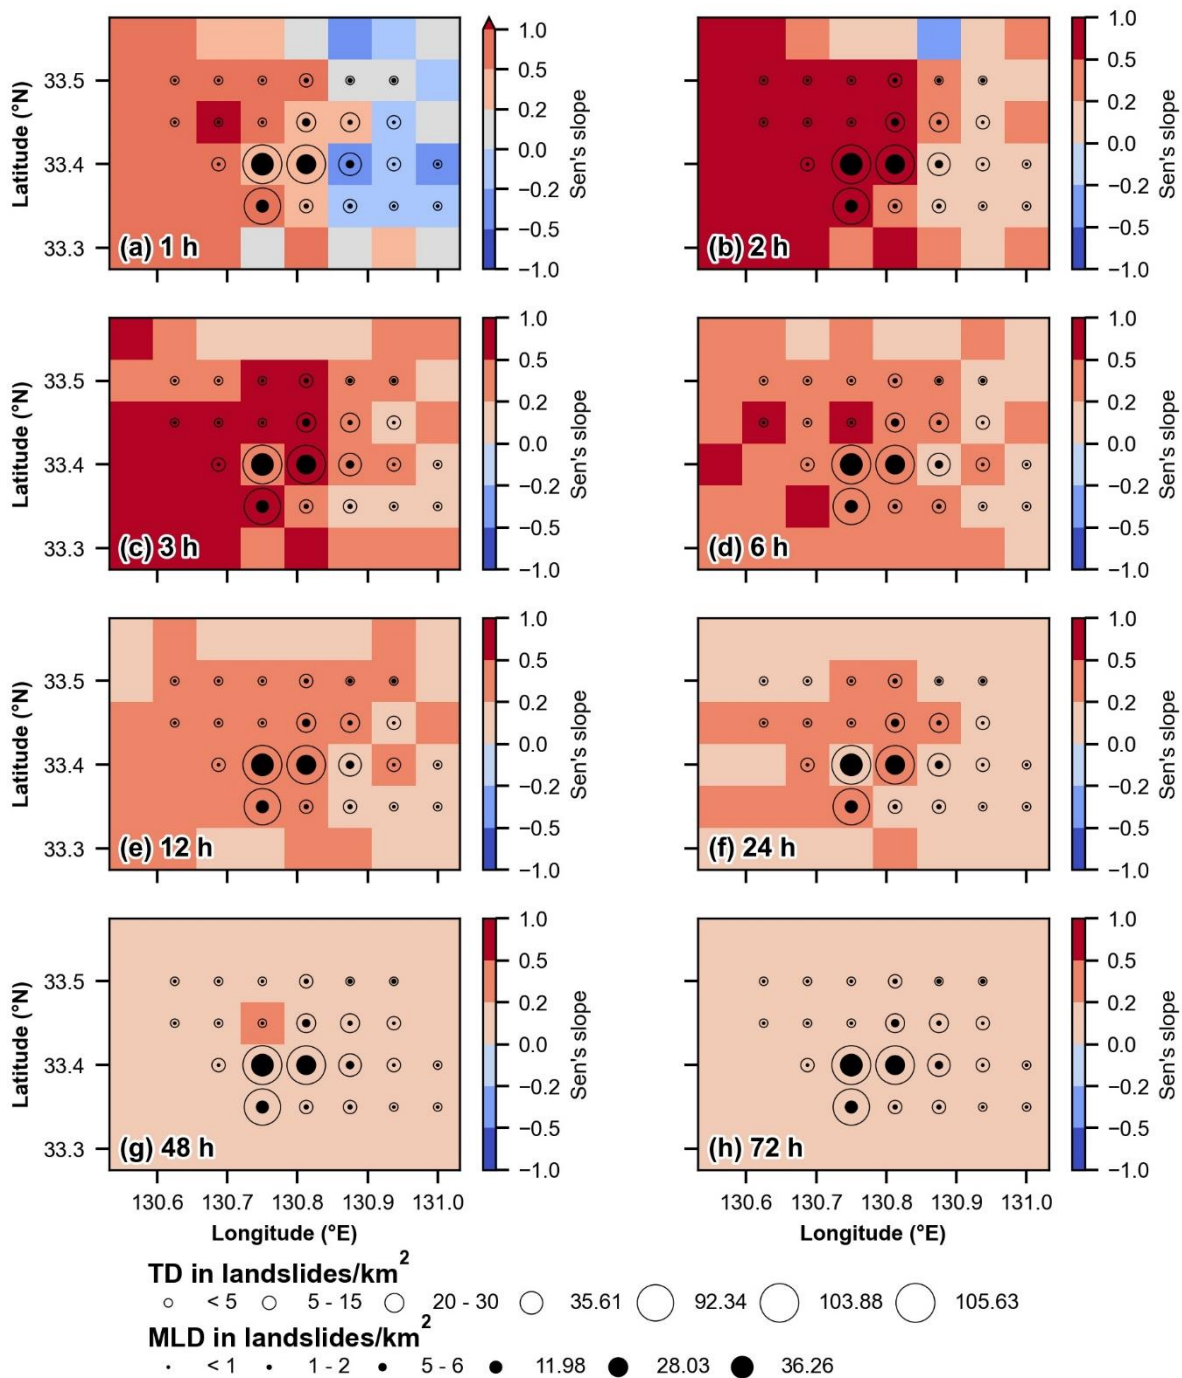

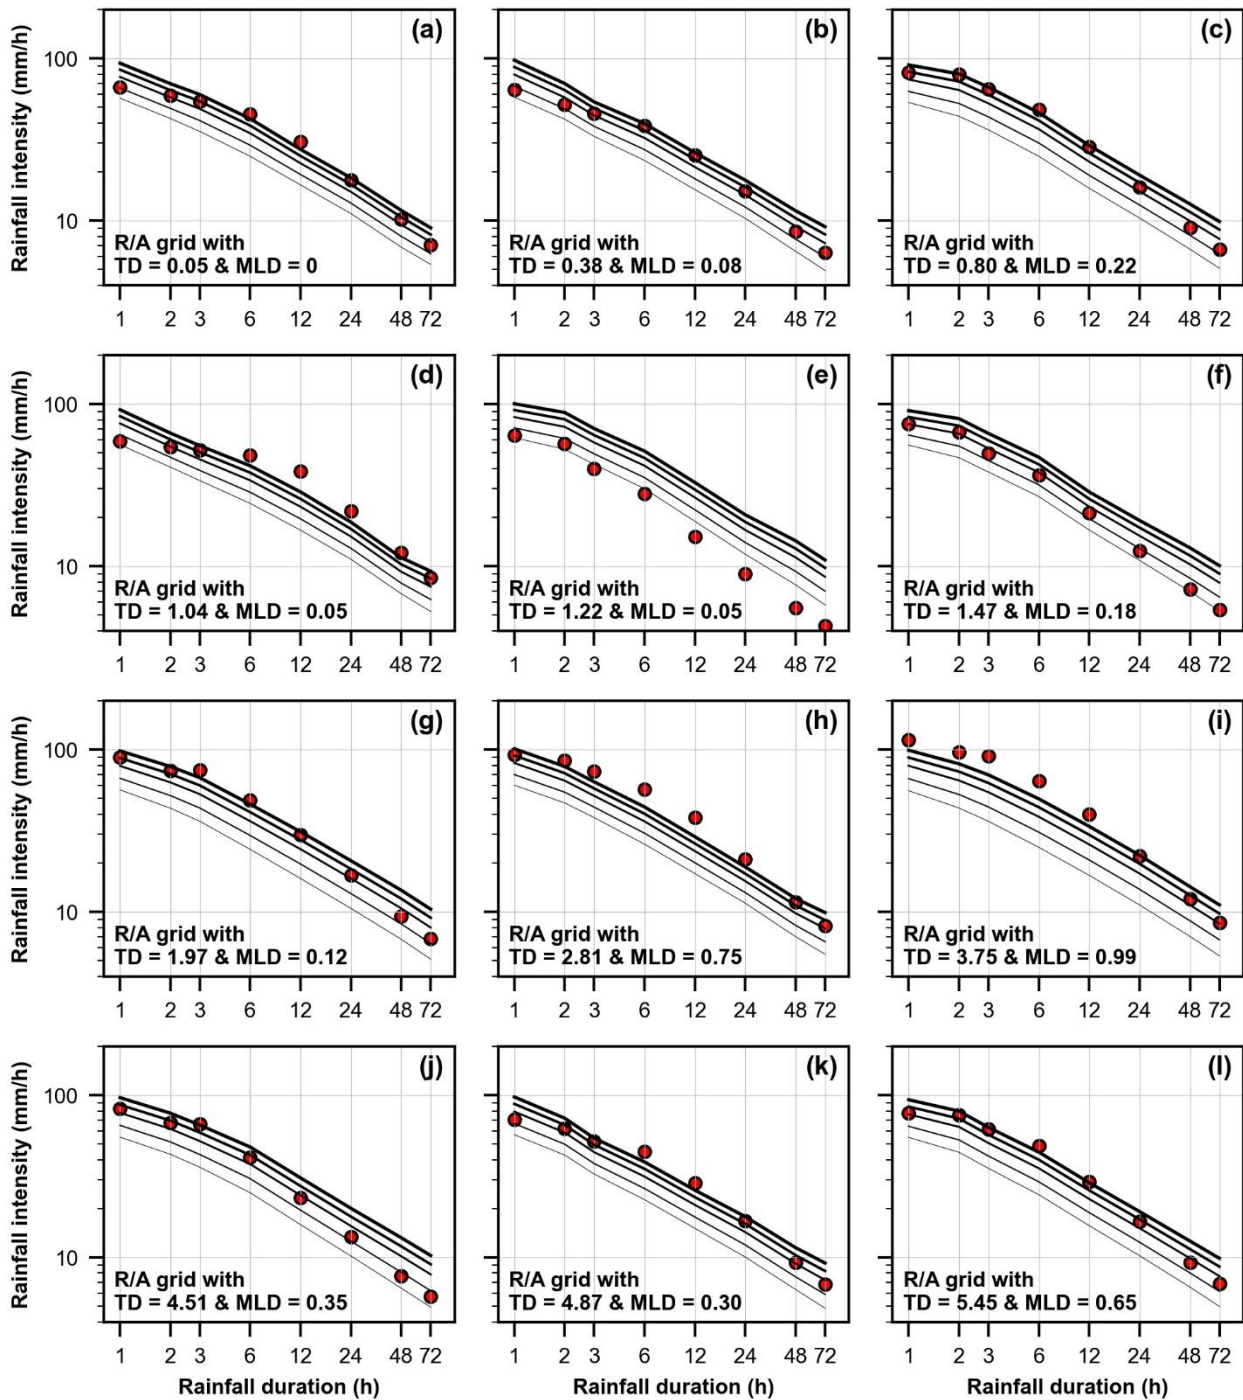

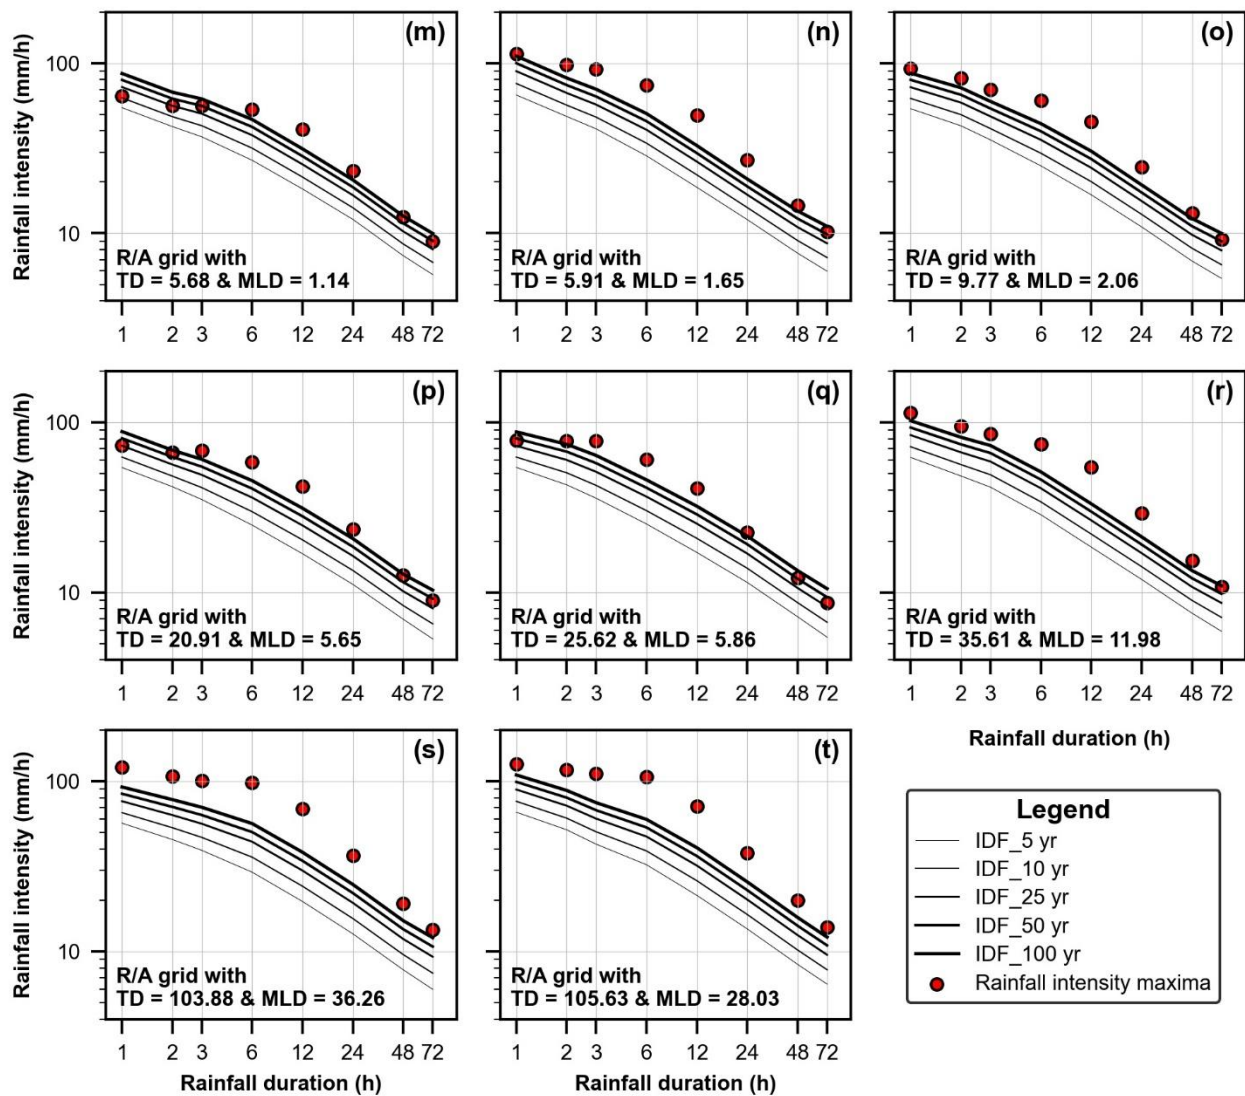

Figure S10: Spatial distribution maps of *p-values* resulted from the Mann-Kendall test

35 Figure S11: Spatial distribution maps of Sen's slope

40 Figure S12: IDF curves and rainfall intensity maxima for multiple timespans (1 – 72 h) within the P_{std} for the different R/A grid cells (excluding three R/A grid cells where landslide occurrence was deemed to be affected by anthropogenic activities).

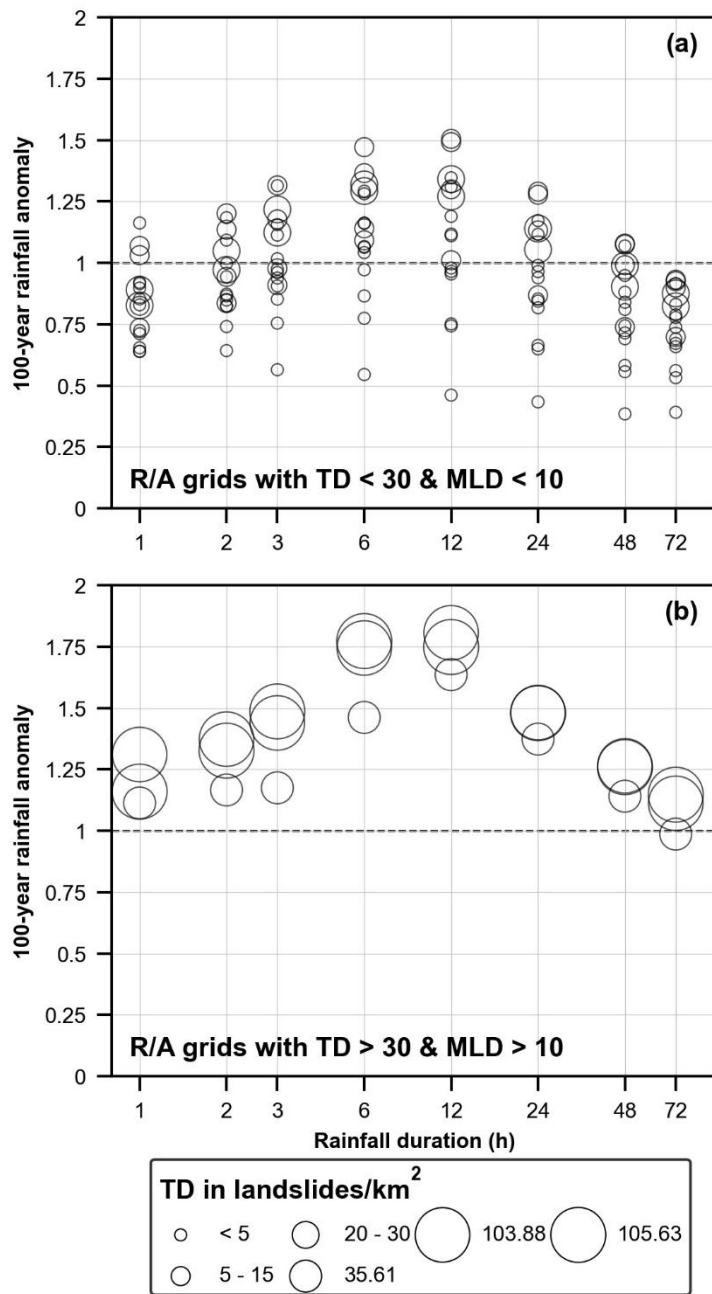

Figure S13: Variation of the 100-year rainfall anomaly at multiple timespans over the R/A grid cells with low (a) and high landslide density (b) (excluding three R/A grid cells where landslide occurrence was deemed to be affected by anthropogenic activities).

Table S1. Adjusted p -values from multiple pairwise comparisons of slope distributions within $A_{threshold}$ using the Dunn's test. The analysis expected three R/A grid cells, where most landslides occurred in areas affected by anthropogenic activities (e.g., slopes surrounding cropland and paddy field). The null hypothesis assumes no significant differences in slope distributions. A p -value higher than a significant level of 5 % leads to accept the null hypothesis. The test was applied after rejecting the null hypothesis of the Kruskal-Wallis static, which indicated significant differences in slope distributions within $A_{threshold}$ of the R/A grid cells.
