

Interactive comment on “Field investigation of preferential fissure flow paths with hydrochemical analysis of small-scale sprinkling experiments” by D. M. Krzeminska et al.

Anonymous Referee #1

Received and published: 4 December 2013

In my opinion I don not think that results of the sprinkling experiments have substantial benefits for landslides studies, providing helpful solutions for specified works. Although the drawbacks of the experiment results regarding scaling problems have been mentioned and defended by the author in Section 4.3, I suggest author propose real examples that have benefited from the experiment results.
