Good paper and interesting results. I have some suggestion to improve the paper: - please explain why you thing that autoumatic or semiautomatic method overperform manual delineation and point to the benefits of its use.

- section 3.1 is superfluous. It is well known forumlas available in many manuals. Only formula (4) is necessary as quaita a new concept

- forumals (5-8) should be change to more symbolic form with expalnation of symbols (abbreviation) in text for example BDL instead of boundary delineantion layer etc.

C150

- comparison with existing or possible manual delineation at the end of the paper (for example at the fig 7) would be a good compelment. Also in conclusions authors could suggest more broad application of thier method except the data they used
