Supplement of

Storm-triggered landslides in the Peruvian Andes and implications for topography, carbon cycles, and biodiversity

K. E. Clark et al.

20	1994	0.016	0.011	63
21	2002	0.013	0.009	53
22	1990	0.003	0.002	77
23	1997	0.001	0.001	56
24	1989	0.000	0.000	78
25	1992	0.000	0.000	47

Figures

Figures S1: Soil carbon stocks and soil depth over various slopes derived from Shuttle Radar Topography Mission (STRM) (Gibbon et al., 2010; Farr et al., 2007). Soil stocks are consistent over a range of hillslopes, with no strong dependence on slope angle, suggesting that the plot-level data on soil stocks for the Kosñipata Valley may not be strongly based by selective topographic position.
