Received and published: 5 June 2015

I have read the two reviews (by Anderson and Roering, who are both experts in the quantitative modelling of glacial and periglacial processes) and agree with the reviewers that the work described in this manuscript is of high quality and will be most useful to the community by providing a simple set of relationships allowing to predict soil formation and transport in periglacial environments. I note that both reviewers request further discussion concerning how water availability is dealt with in the proposed model as well as frost creep. I suggest to the authors to start considering these comments and to, potentially, modify their manuscript to respond to the suggestions/requests from the reviewers. I also note that J. Roering mentions a discussion by email between one of his students and the authors concerning these points (especially water availability).
