

Interactive comment on “Identification of stable areas in unreferenced laser scans for automated geomorphometric monitoring” by Daniel Wujanz et al.

Anonymous Referee #3

Received and published: 21 October 2017

This manuscript aimed to use ICPprox algorithm to determine deformations that occurred at a rock glacier. It is an interesting research, but it has a far distance to acceptance. Some of my advices are the following:

- (1) The method is presented by this researcher or by other researchers. It is not very clear.
- (2) In abstract, the content about this research is limited. Most of the contents are background introduction.
- (3) From the introduction part, I can not find what this research aims to do and why conduct this research?

(4) The manuscript does not have "Discussion" part. Then, what about this research compared to relevant researches?

(5) The accuracy is very low in the first study area, especially for the deformation area.

Overall, I suggest the authors revise the manuscript in written and structure aspects. I do not think the manuscript can be accepted at its current form.
