Received and published: 10 May 2018

I am happy that the authors should proceed on the basis of the comments and reviews received so far. The reviews are admittedly mixed, but on the whole the reviewers feel that there is merit in this work. When addressing the the points that the reviewers identify, the authors should consider how they present and justify the model parameter selection, and whether any model calibration is possible or appropriate. There are also some suggestions for how the model results could be broadly compared with examples from the literature. As identified by a couple of reviewers, a conceptual model might help to summarise the model findings. Finally, I would also encourage the authors to

consider whether there are other parts of the paper that could be made more concise.
