

Dear Editors,

we thank you for your positive feedback and for accepting our work for publication in the ESurf Special Issue on Environmental Seismology.

For this final version we adopted the volume column in Table 1, according to your suggestions. All values are now given in thousands of cubic meters. Unfortunately we do not have proper uncertainty estimates for any of the events, but whenever possible we state the volume range as taken from the respective references.

Note, that we also updated event reference [14] (Mellental). The report is now available for download and we updated the corresponding link.

Thank you very much and with kind regards,

Florian Fuchs and co-authors
