

Supplement 1 to “Simulating the effect of subsurface drainage on the thermal regime and ground ice in blocky terrain, Norway”

1 Simulated subsurface drainage rates

Here, we provide simulated subsurface drainage rates for two model scenarios at Juvvasshøe in addition to air temperature and
5 rainfall at the site.

Suppl. 1, Fig. 1: Air temperature and rainfall (top) and lateral subsurface drainage out of the model realization for the *blocks only* and *blocks with sediment* stratigraphies (see Table 1), both *drained* (bottom) during a year of an equilibrium run at Juvvasshøe. $S_f = 0.25$. The drainage rate is the summed drainage over all grid cells.
